

The Mobile App Project Canvas (ver. 1.0)

Project Name

CDU SyncTime - Student Calendar App

CONCEPT Describe the idea of the app you want to create A calendar app built specifically for Charles Darwin University students. Students log in with their CDU Student ID and the app automatically builds a personal calendar: it blocks out timetabled class times, adds assessment due dates pulled from unit outlines/Learnline, and helps students find and schedule meetings around their busy study and class hours.		OBJECTIVES & PURPOSES What goal do you want to achieve with this project? Remember: it must be measurable and shared with the team • Cut manual timetable set-up time from ~30 min to under 10 min per semester • Reduce missed assessment deadlines among student users by 15% • Achieve 60% adoption among on-campus and online CDU students within first year • Increase successful group-meeting scheduling (fewer back-and-forth messages)		VALUES What creates a real value for your user and which ties him to your product? Focus on max 3 values. • Convenience - one login auto-builds the whole semester calendar, no manual entry • Reliability - always matches official CDU class times and due dates • Time control - makes free time visible so students can plan work, life and group meetings	
PERSONAS Describe the archetype of the users who will use your app. • On-campus student juggling multiple units, casual work shifts and assignments • Distance/online student balancing study across time zones, needs virtual meetings	PROBLEMS TO SOLVE Weaknesses of the current / similar solution. What is not working? What are the critical points? • Building a timetable by hand from the student portal is slow and error-prone • Assessment dates live in Learnline, separate from students' personal calendars • No easy way to see free time across classes to book group or tutor meetings • Timetable changes (room/time swaps) often aren't reflected on personal calendars	COMPONENTS What are the main modules that make up the app? Put all the features in a well defined component. • CDU ID Sync Engine (secure login + data pull from Student Systems/Learnline) • Timetable & Class Block Generator • Assessment Due Date Importer • Free/Busy Meeting Scheduler • Notifications & Reminders • External Calendar Sync/Export			MILESTONES Define the roadmap of the project. Start from the MVP and then scale. • MVP: Student ID login + auto class-block import • V1: + Assessment due date import • V2: + Free/busy meeting scheduler • V3: + External calendar sync & notifications • V4: Pilot with one faculty, then university-wide rollout
STAKEHOLDERS Who need to be involved in the project? What is their role and who makes the decisions? • CDU students (end users) • CDU IT / Student Systems team (data access & integration) • Learnline (LMS) administrators • Faculty project sponsor (decision maker) • CDU Privacy & Data Governance office • Development/project team	RISKS Every project has risks, knowing which at the beginning allows mitigating them. • CDU Student System/Learnline may not expose a usable API • Privacy/data security compliance (Australian Privacy Act, student data) • Timetable changes not reflected in real time which may lead to incorrect blocks • Dependent on CDU IT approval for integration and ongoing support • Low adoption if students don't trust or feel comfortable using the app	FEATURES What the app should do? What services are provided? List all the features your users expect to find. • Sign in with CDU Student ID and portal credentials • Automatic import of enrolled units and class times each semester • Class times auto-blocked as “busy” events, colour-coded by unit • Assessment due dates auto-added as events with reminder alerts • Free-time finder to propose and schedule meetings around busy hours • Shareable availability link/poll for group assignment meetings • Push notifications for upcoming classes and approaching deadlines • Two-way sync/export to Google Calendar, Outlook and Apple Calendar • Automatic re-sync when enrolment or timetable changes • Offline access to a cached copy of the calendar			DELIVERABLES What will the team have to produce? In addition to the app you could have a UI prototype, a middleware, a launch plan, documentation ... • Mobile app (iOS & Android) • UI/UX prototype & wireframes • CDU Student Systems/Learnline integration middleware • Data privacy & security assessment • Launch/rollout plan with CDU IT • User guide & support documentation
APP NAME :) SyncTime (CDU)	CONTEXT OF USAGE & COVERAGE Where will the app be used? With full WiFi/4G signal or offline mode? On and off campus across Darwin, Casuarina, Palmerston, and remote NT campuses; supports both full WiFi/5G connectivity and offline mode with a cached calendar for low-signal areas.	TECHNOLOGY Native, HTML, Hybrid, ... Hybrid (e.g. Flutter/React Native) for a single codebase across iOS and Android, with a secure API/middleware layer connecting to CDU Student Systems and Learnline.	PLATFORM, OS, ... Which device and operating system? iOS and Android smartphones and tablets; companion responsive web view for desktop access.	ORIENTATION Portrait, Landscape or both Supports both portrait and landscape orientations.	RELEASE Public Marketplace or Enterprise App Store? Enterprise distribution via CDU student portal / MDM initially; possible future public app store listing.
