

Tester Week1 Task - Manual Test Cases

Monday, September 7, 2026 21:51

Practice: Pick any public website/app. Write a test plan and 15 manual test cases (functional, negative, boundary) for one feature (e.g., login form). Log 3 intentional "bugs" you find in a free tool like Trello or a bug-tracker template.

Test Plan: YouTube Search Bar

- **Objective:** Validate the functionality, input handling, and boundary limitations of the primary YouTube search bar on the web application.
- **Scope:** In-scope includes text input, button clicks, keyboard shortcuts, auto-suggest, and clear functions. Out-of-scope includes the backend search ranking algorithm.
- **Environment:** Chrome Desktop (latest version), Windows/macOS.

Test Cases (15 Scenarios)

ID	Type	Scenario	Steps to Reproduce	Expected Result
TC01	Functional	Search valid keyword	1. Enter "Python tutorial" 2. Press Enter	Navigates to search results related to Python.
TC02	Functional	Search via icon	1. Enter "Music" 2. Click magnifying glass icon	Navigates to search results related to Music.
TC03	Functional	Auto-suggest display	1. Type "Tech"	Dropdown appears with relevant suggestions (e.g., Tech news).
TC04	Functional	Auto-suggest selection	1. Type "Tech" 2. Click first suggestion in dropdown	Search executes automatically for the clicked suggestion.
TC05	Functional	Clear input via 'X'	1. Type "Hello" 2. Click the 'X' icon inside the search bar	Input field is completely cleared.
TC06	Functional	Voice search trigger	1. Click the microphone icon	Prompts for browser microphone permission/starts listening.
TC07	Negative	Empty search submission	1. Leave search bar blank 2. Click search icon	No action is taken; remains on the current page.
TC08	Negative	Whitespace only	1. Enter 5 space characters 2. Press Enter	No action is taken, or spaces are trimmed preventing empty search.
TC09	Negative	XSS Injection attempt	1. Enter <script>alert('1')</script> 2. Press Enter	Search executes as literal string; no alert box triggers.
TC10	Negative	SQL Injection attempt	1. Enter DROP TABLE users;-- 2. Press Enter	Search executes as literal string; no database error occurs.
TC11	Negative	Special character heavy	1. Enter !@#\$%^&*()_+	Handles characters gracefully and searches the literal string.
TC12	Boundary	Minimum character	1. Type exactly "a"	Auto-suggest triggers immediately based on one character.
TC13	Boundary	Maximum character limit	1. Paste a string of 10,000 characters into the bar	Input truncates at the maximum allowed character limit (e.g., 2048 chars).
TC14	Boundary	Rapid click submission	1. Enter "Test" 2. Click search icon 10 times rapidly	Only one search request is sent to the server (debounced).
TC15	Boundary	Copy/Paste behavior	1. Copy text from another app 2. Right-click and paste into bar	Text pastes correctly without breaking UI formatting.

Testing Types Explained

- **Functional Testing:** Verifies that the software features work according to business specifications and user expectations. It focuses on the "happy path"—valid inputs producing the correct outputs.
 - *Example:* Entering a correct username and password and successfully logging in.
- **Negative Testing:** Evaluates how the system handles invalid, unexpected, or unauthorized actions. The goal is

to ensure the software does not crash and displays helpful, graceful error messages instead.

- *Example:* Submitting an empty login form or attempting to inject malicious characters into a text field.
- **Boundary Testing (Boundary Value Analysis):** Tests the extreme limits and transitions of an input range (minimum, maximum, just inside, and just outside the acceptable boundaries). Software bugs frequently cluster at boundary edges due to conditional logic errors (such as < versus <=).
- *Example:* If an input accepts 1 to 100 characters, you test lengths of 0, 1, 100, and 101.

Logged Bugs (Trello Card Format)

Bug-001: 'X' clear button overlaps with long search queries

- **Severity:** Minor
- **Steps to Reproduce:**
 1. Type a continuous string of 150 characters into the search bar.
 2. Observe the right side of the search input field.
- **Actual Result:** The typed text runs underneath the 'X' (clear) icon, making the final characters unreadable.
- **Expected Result:** Text should stop or scroll before reaching the 'X' icon area to maintain readability.

Bug-002: Auto-suggest dropdown does not dismiss when text is rapidly deleted

- **Severity:** Medium
- **Steps to Reproduce:**
 1. Type "Software Testing" (dropdown appears).
 2. Hold down the Backspace key until the search bar is completely empty.
- **Actual Result:** The auto-suggest dropdown for "Software Testing" remains visible on the screen despite the input being empty.
- **Expected Result:** The dropdown should immediately disappear the moment the search bar becomes empty.

Bug-003: Whitespace-only search redirects to a blank results page

- **Severity:** Medium
- **Steps to Reproduce:**
 1. Click into the search bar.
 2. Press the Spacebar 3 times.
 3. Press Enter.
- **Actual Result:** The page navigates to youtube.com/results?search_query=+ and displays a blank UI with no video results or error message.
- **Expected Result:** The search submission should be blocked (similar to a completely empty search), keeping the user on their current page.
