

Week 5 Progress Report

Enterprise Governance, Multi-Platform Distribution & Pixel-Perfect Reporting

PROJECT**Store Spatial Sales Analytics****PREPARED BY****Amanparteek Singh****28 SEPTEMBER 2026**

Progress at a glance

A browser-based paginated report has been built using the existing Store Spatial Analytics semantic model. This update documents the report layout, selected fields, filtering controls and successful save state. The PDF export has also been completed, as reported during the project work.

Week 5 milestone tracker

Paginated report design

Saved report layout and transaction-level detail table.

COMPLETED**Filtering and report preview**

Region, StateName and CalendarYear controls are visible.

COMPLETED**PDF output**

PDF export reported complete; exported file not included here.

COMPLETED***Dynamic regional RLS**

Security table, role configuration and account testing pending.

NEXT**Email distribution / governance**

Subscriptions and deployment/access review to follow.

PLANNED**CURRENT DELIVERABLE**

A saved operational audit paginated report with a multi-column order table, report-preview filters, and a PDF export milestone. Screenshots on pages 2-3 are the evidence for this update.

* Export status is based on the student's project update, not a captured PDF validation.

Paginated report layout in Fabric

The screenshot below records the browser-based Fabric editing view. It shows the audit-report heading, the detailed table configuration, a totals row, the right-side filter panel and the report preview within the same editing environment.

Figure 1. Editing the Monthly Operational Audit Report in the Microsoft Fabric browser editor (browser address bar excluded for public sharing).

Implemented in this iteration

- 1 Operational detail fields**
OrderID, CustomerName, StateName, Region, ProductName, Quantity, Sales and Profit appear in the table design.
- 2 Print-oriented structure**
The report has a clear title and subtitle, a transaction-detail table and visible total expressions for quantity, sales and profit.
- 3 Interactive selection controls**
The editor shows Region, StateName and CalendarYear controls in its preview area; other fields are available in the Filters pane.

Scope note: This screenshot demonstrates the Fabric browser editor, not the separately installed Power BI Report Builder desktop application.

Saved report and filtered preview

The second screenshot confirms that Fabric displayed a successful save notification and rendered the report preview. The visible Region selector is set to East and the StateName selector shows multiple selected values.

Figure 2. Report preview with filter controls and a "Save successful" confirmation in Microsoft Fabric.

Next validation and implementation steps

- 01

Validate report filters

Cross-check StateName selections against preview rows and check the CalendarYear selection.
- 02

Implement dynamic regional RLS

Load a RegionManagers mapping table, configure a role and test access with regional Viewer accounts.
- 03

Complete distribution checks

Review PDF page breaks and totals, verify Excel export if required, and evaluate an email subscription.

PROGRESS STATEMENT

The paginated-report milestone is materially underway and the report has been saved. Regional data security and automated distribution are subsequent Week 5 tasks; no claim of completed RLS testing is made.
