

Tester (QA) Essential Tool Table

Sunday, September 13, 2026 15:43

Tool	Category	What it is	Why it is used	Common Use Cases	Simple Example / Implementation
Chrome DevTools	Web Testing	A set of web authoring and debugging tools built directly into the Google Chrome browser.	To inspect and debug front-end code, simulate mobile devices, and analyze network performance.	Testing HTML/CSS, checking network requests/responses, and clearing cookies.	Simulating a slow 3G internet connection to inspect network loading performance.
BrowserStack	Web Testing	A cloud-based web and mobile testing platform that enables testing websites across various real browsers and OS.	To verify cross-browser compatibility and front-end display consistency without physical device labs.	Testing web applications across different device environments and OS versions.	Testing an e-commerce website layout on Safari running on an iOS device remotely.
Android Studio & Xcode	Mobile Testing	Official Integrated Development Environments (IDEs) for Android (Android Studio) and iOS/macOS (Xcode).	To deploy, run, and debug native mobile applications on emulators, simulators, or physical devices.	Performing mobile application functional testing and verifying app installations.	Verifying successful application installation and crash logs on an Android emulator.
Postman	API Testing	An API platform for building, testing, modifying, and documenting APIs.	To test backend services and RESTful endpoints without relying on the user interface.	Sending HTTP requests (GET, POST, PUT, DELETE) and validating backend payloads.	Sending an API POST request to verify if a user successfully registers in an e-commerce database.
Apache JMeter	Performance Testing	An open-source Java software designed to load test functional behavior and measure system performance.	To simulate heavy concurrent traffic and evaluate application scalability and response times under stress.	Simulating high user loads to check server and web page loading performance.	Simulating 1,000 users trying to load a web page simultaneously in 1 second.
Wireshark	Network Traffic Capturing	A widely-used network protocol analyzer that captures and interactively browses traffic running on	To inspect deep-level network packets, diagnose connectivity issues, and analyze protocol behaviors.	Analyzing network-specific testing scenarios, packet loss, and data streams.	Tracking which IP addresses encountered packet loss during connectivity drop periods.

		computer networks.			
Jira & TestRail	Test Management	Enterprise platforms dedicated to issue tracking, project management (Jira), and test case organization (TestRail).	To plan, track, manage, and document test cases, test cycles, and defect reports across projects.	Writing test scripts, organizing test suites, and linking test execution results to requirements.	Creating and tracking a defect ticket through its lifecycle from "Open" to "Resolved".
OWASP ZAP & Burp Suite	Security Testing	Leading web application security scanners and proxy tools used for penetration testing.	To conduct security assessments, identify vulnerabilities, and secure web applications against attacks.	Vulnerability scanning, intercepting HTTP traffic, and detecting security flaws like SQL injection.	Running an automated security vulnerability scan against a login portal to check for flaws.
Snagit & Greenshot	Screen Capture Tools	Advanced screen capture and image annotation software designed for documentation and reporting.	To capture, annotate, and share screenshots quickly, improving bug reporting efficiency for manual testers.	Documenting software defects, highlighting UI errors, and creating visual test evidence.	Capturing a screenshot of a broken UI layout, highlighting the error box, and attaching it to a bug ticket.
Selenium & Appium	Test Automation	Industry-standard frameworks for automating web browsers (Selenium) and mobile applications (Appium).	To execute repetitive test scripts automatically across browsers or mobile platforms, reducing manual effort.	Regression testing suites, cross-platform validation, and automated functional workflows.	Writing a Selenium script to automatically open a browser, fill out a form, and submit.
ChatGPT	Innovative Tools	An advanced generative AI language model developed by OpenAI.	To assist testers with brainstorming, test case generation, script writing, and problem-solving.	Generating edge-case test scenarios, writing boilerplate automation scripts, and debugging code.	Prompting ChatGPT to generate boundary-value test cases for an age-validation input field.
