

Business Analyst Week 1 Task

Wednesday, September 2, 2026 17:35

Practice: Pick a real app you use daily (e.g., a food delivery app). Write a 1-page Business Requirements Document (BRD) and 5 user stories with acceptance criteria for one feature (e.g., "reorder past meal").

Business Requirements Document (BRD)

Project Name: Uber Eats Group Order

Application: Uber Eats Mobile App

Author: Business Analyst

Version: 1.0

1. Executive Summary & Business Objective

- **Problem Statement:** Coordinating food delivery for multiple people (e.g., office lunches, family dinners) is currently a manual, chaotic process. One person must collect orders, handle complex customizations, and calculate individual costs, leading to errors and high cart abandonment rates.
- **Business Objective:** Implement a "Group Order" feature allowing a Host to generate a shareable link so Guests can join, browse, and add their own customized items to a single, unified shopping cart.
- **Success Metrics (KPIs):**
 - Increase Average Order Value (AOV) by 20% for users initiating group orders.
 - Achieve a 15% adoption rate among enterprise/business profile users within Q1.

2. Project Scope

- **In-Scope:**
 - Host ability to generate and share a unique session link.
 - Guest ability to join the session via link (with or without an Uber account).
 - Host ability to set a countdown timer (deadline) for order submission.
 - Consolidated cart view showing who ordered what.
 - Single payment execution by the Host.
- **Out-of-Scope:**
 - Split payments (multiple credit cards processing simultaneously for one order).
 - Guests modifying the delivery address or tipping amount.

3. Target Personas

- **The Office Coordinator (Host):** Frequently orders lunch for the team and needs a stress-free way to collect exact preferences and track who owes what.
- **The Social Diner (Guest):** Wants to easily view the selected restaurant, pick their meal, and ensure their specific dietary requirements are noted.

4. Business Rules & Constraints

- **BR-01:** Only the Host can initiate the final checkout and payment process.
- **BR-02:** If the Host cancels the group order session, all Guest carts are instantly cleared and Guests are notified.
- **BR-03:** The maximum number of distinct Guests per group order is capped at 20 to prevent restaurant capacity and delivery vehicle constraints.

User Stories & Acceptance Criteria

US-01: Initiating a Group Order & Sharing

- **User Story:** As a Host, I want to create a group order link from a restaurant's page so that I can easily invite friends to add their meals.
- **Acceptance Criteria:**
 - **Given** a user is on a restaurant's menu page,
 - **When** they tap the "Group Order" icon,
 - **Then** the system generates a unique, shareable URL and opens the native OS sharing sheet (SMS, WhatsApp, Email).

US-02: Guest Joining & Adding Items

- **User Story:** As a Guest, I want to click a shared link to access the specific restaurant menu and add my meal directly to the Host's cart.
- **Acceptance Criteria:**
 - **Given** a Guest receives and taps the group order link,
 - **When** the app opens,
 - **Then** they are placed directly into the Host's selected restaurant menu with a banner stating "Adding to [Host Name]'s Order".

- **And** when they add items, the items are tagged with their profile name (or a guest name they input).

US-03: Setting an Order Deadline

- **User Story:** As a Host, I want to set a countdown timer for the group order so that I am not waiting indefinitely for people to choose their food.
- **Acceptance Criteria:**
 - **Given** the Host has initiated a group order,
 - **When** they access the group settings,
 - **Then** they can select a predefined deadline (e.g., 15 mins, 30 mins, 1 hour).
 - **And** a live countdown timer appears at the top of the screen for all participants.
 - **And** when the timer hits zero, the cart automatically locks, preventing Guests from adding more items.

US-04: Host Reviewing the Consolidated Cart

- **User Story:** As a Host, I want to see a broken-down view of the cart by person so that I know exactly who ordered what and how much their subtotal is.
- **Acceptance Criteria:**
 - **Given** multiple Guests have added items to the group order,
 - **When** the Host navigates to the Cart page,
 - **Then** the items are visually grouped by Guest name.
 - **And** each Guest's individual subtotal is displayed next to their name, alongside the overall order total.

US-05: Modifying Guest Items (Host Override)

- **User Story:** As a Host, I want the ability to remove a Guest's item from the final cart so that I can keep the order within a specific corporate budget.
- **Acceptance Criteria:**
 - **Given** the Host is reviewing the consolidated cart prior to checkout,
 - **When** the Host swipes left on any item added by a Guest,
 - **Then** a "Remove" button appears.
 - **And** if removed, the item disappears from the cart, the total updates, and the affected Guest receives an in-app notification that their item was removed by the Host.
