Week 2 — Process Modeling & Tools

Course

Learning BPMN (Business Process Model and Notation)

Learning Visio

Research or examine the following key items: **capabilities**, **business processes** (define all three levels), **user personas**, **user stories**, and **requirements**. Understanding how these elements are interconnected is crucial. Write examples of each topic and explain to team

1. Capability (The "What")

- **Definition:** What the business needs to be able to do to stay competitive. It's a high-level goal, not a technical solution.
- **Example:** The business needs the capability of "**Collaborative Ordering.**"

2. Business Processes (The "How")

- **Definition:** The step-by-step actions taken to execute that capability. It is broken down into three levels of detail:
 - **Level 1 (Strategic / High-Level):** The bird's-eye view of the entire value chain.
 - *Example:* The "Food Ordering to Delivery" process.
 - **Level 2 (Operational / End-to-End):** A specific, end-to-end operational flow within Level 1.
 - *Example:* The "Group Checkout and Payment" process.
 - **Level 3 (Task / Detailed):** The exact, step-by-step actions a specific user takes.
 - *Example:* 1. Host creates cart → 2. Host generates link → 3. Guest adds burger → 4. Host pays.

3. User Personas (The "Who")

- **Definition:** Fictional profiles of the exact people who will use this process, highlighting their pain points and goals.
- **Example:** "**The Office Coordinator (Host)**" who frequently orders Friday lunches for the IT team and hates chasing people for money.

4. User Stories (The "Need")

- **Definition:** A short, simple feature request written purely from the Persona's perspective. (Format: As a [Persona], I want [Action], so that [Benefit]).
- **Example:** "As an Office Coordinator, I want to generate a shareable link so that my team members can add their own food directly to my cart."

5. Requirements (The "System Rules")

- **Definition:** The strict technical or business rules the developers must build to make the User Story a reality.
- **Example (Functional):** The system must allow a maximum of 20 guests to join a single group order link.
- **Example (Non-Functional):** The shareable link must be generated by the server in under 1.5 seconds.

Example:

Our business wants the **Capability** of collaborative ordering. To do this, we map out the **Business Process** of how a group checkout works. But to design that process well, we need to understand **Who** is using it, so we create the Office Coordinator **User Persona**. We then write a **User Story** to capture what that coordinator needs (a shareable link). Finally, we turn that story into strict, testable **Requirements** (max 20 people) so our developers know exactly what code to write and our testers know exactly what to test.

Explain and examples of each topic

- **Business Process Model and Notation (BPMN) Diagram**
- **Use Case Diagram**
- **Entity-Relationship (ER) Diagram**
- **Data Flow Diagram (DFD)**
- **Wireframe or Mockup Diagram**
- **Swimlane Diagram (Cross-Functional Flowchart)**
- **Gantt Chart**
- **Stakeholder Map**
- **State Diagram**
- **Requirement Traceability Matrix (RTM)**
- **Gap Analysis Diagram**
- **Activity Diagram**
